

## SERIE 160

# Sealing unit for incorporation – single station TCE260A

The standard sealing unit **TCE 260A** (by conduction or by induction), has been specially designed for incorporation on automatic filling and capping machines.

These units are designed for the sealing of pre-cut aluminium or PET lids.

The machine takes the pre-cut lid, places it on the jar and seals it all in one operation. Sealing and positioning of the lid are perfectly reproducible. Only one station is required for the sealing operation, with an average turnout 20 operations per minute.

Changing sizes is quick and easy and the height (with auto-blocking system) can be adjusted hence the polyvalence and the flexibility of the unit (standard units can deal with diameters ranging from 25 to 100 mm).

PHOTO NON CONTRACTUELLE

The unit is equipped with a vertical magazine that can hold between 500 to 800 lids, and which is placed on the front of the unit. It is then very easy to load the magazine or to change it to another size lid.

These units exist in a full version, with electric box and touch screen and in specific versions for OEMs. They can be adapted to your particular specifications (e.g. without electric box, volume, protective glazing).

This unit is a component to be incorporated by fully skilled staff. Ce module est un composant à intégrer par du personnel qualifié. Il n'est pas fonctionnel et n'est pas certifié CE en l'état. The electrical junction, the mechanical incorporation and the compliance to the safety standard upgrade are the integrator's responsibilities; the integrator remains the responsible of the CE certification of his own machine, including the TCE260A unit.
